Digital Nomad & Corporate Visa Recommendation System

(DNCVRS)

To: Ministry of Digital Economy
From: IT & Development Division
Date: February 2026

1. Introduction

The Digital Nomad & Corporate Visa Recommendation System (DNCVRS) is a digital platform designed to manage and automate the Ministry's process of recommending foreign digital professionals for visa approvals.

Currently, the Ministry issues recommendation letters to the Immigration Department through manual and paper-based processes. This traditional approach leads to delays, human errors, and difficulties in tracking applications. The proposed system aims to replace the existing manual workflow with a secure, automated, and data-driven portal. The system will ensure that each recommendation is efficiently processed, tracked, and securely stored from application submission to final approval.

2. Current Challenges

The Ministry currently relies on manual, paper-based processes that create significant operational bottlenecks, similar to challenges identified in broader document management.

- **Manual Letter Drafting:** Officers are required to individually type and format recommendation letters for each applicant, causing delays and increasing the risk of errors—such as issuing an 'Arrival' letter instead of the required 'Extension."
- **Lack of Visibility:** Without a digital system, tracking the volume of Digital Nomads entering the country versus those renewing their status is nearly impossible.
- **Verification Delays:** Verifying physical documents (Passports, Bank Statements) requires significant desk time. There is no centralized digital "footprint" to verify who reviewed a document or when it was approved.

3. The Proposed Solution: The "4-Tier Logic Engine"

Instead of a simple data entry form, we will implement a **Smart Categorization Engine**. Based on the specific operational requirements of the Ministry, the system is architected to automatically route applicants into one of four distinct strategic paths:

1. **Nomad - Arrival:** For individual digital professionals applying to enter Sri Lanka.
2. **Nomad - Extension:** For professionals currently in-country seeking to renew their status.
3. **Company - New Visa:** For technology firms requesting visas for new foreign talent.
4. **Company - Extension:** For technology firms renewing visas for existing staff.

Key Automation Features:

- **Dynamic Document Routing:** The system requests specific evidence based on the category (e.g., "Bank Statements" for Nomads vs. "Company Profile" for Corporates).
- **Instant Letter Generation:** Once a Ministry officer clicks "Approve," the system automatically selects the correct template (1 of 4) and generates the official PDF Recommendation Letter, eliminating manual typing.

4. System Scope

The DNCVRS is designed to handle the end-to-end lifecycle of the recommendation process.

4.1 Applicant Portal (Public Facing)

- **Secure Registration:** Applicants create protected user accounts to submit and monitor applications.
- **Digital Submission:** Applicants upload high-quality digital copies of passports, financial statements, and health certificates, reducing dependency on physical document storage.
- **Real-Time Status Tracking:** Applicants can monitor application progress, including statuses such as "Pending," "Under Review," and "Approved."
- **Reduce Processing Time:** The system automates application submission, document routing, and recommendation letter generation, allowing officers to process applications faster and reducing delays caused by manual paperwork.
- **Improve Document Verification Accuracy:** The system uses digital document validation and structured upload requirements to reduce errors, ensure completeness, and help officers verify documents more accurately.
- **Enhance System Transparency:** The system allows applicants to track application progress in real time and maintains audit records of officer actions, ensuring accountability and clear communication throughout the process.

4.2 Administration Portal (Ministry Facing)

- **Centralized Dashboard:** A unified view of all incoming requests, filterable by the four categories (Nomad/Company/Arrival/Extension).
- **One-Click Verification:** Admins can view applicant data side-by-side with uploaded proofs for rapid decision-making.
- **Audit Trail:** The system maintains a permanent record of which officer approved a recommendation and at what time, ensuring total accountability.

4.3 Technical Infrastructure

The system is built on a robust database architecture ensuring data integrity:

- **users_tbl:** Stores user credentials and role-based access permissions.
- **applications_tbl:** Stores application details, visa categories, and processing status.
- **documents_tbl**: Manages uploaded applicant documents.
- **audit_logs_tbl**: Records officer actions and system activity logs.
- **notifications_tbl:** Stores system alerts and communication messages.

5. System Functional Requirements

5.1 User Registration & Authentication Mod ule

This module manages secure user account creation and access control.

Features:

- User account creation
- Email / Phone OTP verification
- Secure login system
- Password reset option
- Multi-factor authentication
- Role-based access control

5.2 Visa Application Management Module

(Combine Online Application + Tracking)

Features:

- Online visa application forms
- Multiple visa categories
- Smart dynamic forms
- Save and continue option
- Application status tracking
- Tracking number generation

5.3 Document Management Module

Features:

- Secure file uploads
- Document format validation
- Online document preview
- Document expiry reminders

5.4 Administration & Officer Management Module

Features:

- Application review dashboard
- Application filtering
- Approval / Rejection system
- Workload monitoring

5.5 Notification & Communication Module

Features:

- Email notifications
- Internal messaging system

5.6 Reporting & Analytics Module

Features:

- Application statistics
- Approval rate reports
- Processing time analysis
- Revenue monitoring

6. Key Benefits

The implementation of the DNCVRS will provide immediate improvements to the Ministry's operations:

- **Increased Efficiency:** The time taken to issue a recommendation letter will drop from days to minutes, as physical files no longer need to be transported between desks.
- **Data-Driven Insights:** The Ministry will own a comprehensive dataset of the Digital Nomad ecosystem, allowing for better policy decisions regarding foreign digital talent.
- **Enhanced Security:** Sensitive documents (Passport copies) are stored securely, accessible only to authorized personnel.
- **Standardization:** Ensures that every letter issued by the Ministry follows a strict, error-free format compliant with Immigration Department standards.

7. Key Benefits

Phase	**Activity**	**Duration**
Phase 1	Requirement Analysis	Weeks
Phase 2	UI/UX Design	Weeks
Phase 3	System Development	Weeks
Phase 4	Testing & Security Audit	Weeks
Phase 5	Deployment & Training	Weeks

8. Conclusion

The Digital Nomad & Corporate Visa Recommendation System (DNCVRS) is a transformative initiative that modernizes the Ministry of Digital Economy's visa recommendation process. By replacing manual procedures with a secure and automated digital platform, the system enhances efficiency, transparency, and accountability. It reduces processing time, minimizes administrative workload, and ensures standardized documentation with improved data security.

Real-time tracking and integrated reporting enable informed, data-driven policy decisions. The implementation of DNCVRS strengthens Sri Lanka's digital governance framework and supports efforts to attract global digital professionals and corporate investors, reinforcing the country's position as a competitive digital economy hub.
